AI-POWERED PREDICTIVE ANALYTICS FRAMEWORK FOR EARLY DIAGNOSIS AND PROGRESSION MONITORING OF VARICOSE VEIN DISORDERS

---

**Abstract**

A third of the world's adult population suffers from Varicose Vein Disorder (VVD), a chronic venous disease that compromises quality of life. Current diagnosis relies on clinical assessment and Doppler ultrasound, which are subjective and operator-dependent, and lack predictive capabilities. This paper proposes an AI-driven predictive analytics platform integrating wearable sensors, electronic health records (EHRs), and Doppler ultrasound imaging. Deep learning models—LSTM for temporal tracking and CNNs for imaging analysis—work together to enhance diagnostic accuracy. Explainable AI (XAI) techniques such as SHAP and LIME enable interpretation of important variables including vein diameter and reflux duration. Evaluated on 2,500 patient samples, the system achieved 92% accuracy for early diagnosis and 87% accuracy for predicting disease progression. The solution improves clinical decision-making and supports early intervention. Future work includes integrating 3D imaging and large-scale deployment in clinical trials.
